Introduction

In today's society, first responders may be called to incidents involving large animals. Proper training of best practices and appropriate use of specialized rescue equipment can improve the chances of a successful rescue and minimize risk of injury to both animals and first responders. This reference sheet has been developed as a part of the workshop offered by Equine Guelph. The techniques reflected in the reference sheet should not be attempted without appropriate training. The improper use of the referenced technique(s) can potentially cause serious injury to both first responders and animals.

Backwards Drag

https://youtu.be/C5q34rwuukY

- This technique can be used to assist an animal out of an entrapment.
- It can be used on an animal that is standing or is in sternal or lateral recumbency.
- There are two configuration methods: the basket and lark's foot (also choke or cinch) configuration.

Equipment

- Halter (use an emergency rope halter if a halter is not available)
- Webbing (15m x 12-15 cm webbing with sewn loop ends. Centre of the webbing is clearly marked.)
- Strop Guide or Lunge Whip (may not be required if the webbing can be “flossed” under the animal).
- Reach tool(s)
Operation
- Review “Action at Scene”
- An animal handler is appointed and places a halter on the animal and establishes head control
- Responders approach the animal on both sides keeping in mind the safety zones

Safety
- When using the flossing technique, be careful to avoid abrasion or friction burn injuries to the animal
- Ensure eye protection for a recumbent animal
- If a recumbent animal is being pulled for any distance it should be pulled onto a tarp or glide to prevent abrasions and cuts.
- If a glide is being used, guide ropes should be attached with additional rescuers prepared to “haul” at the same time rescuers are pulling/hauling the animal.

Basket configuration:
- *On a recumbent animal* use the flossing method to slide the webbing under the animal to the level of its hips.
- The webbing is passed over the animal from its back towards its hooves
- *On a standing animal* reach tools will be required to place the webbing on the animal's back at its hips and to thread the webbing between the animal's rear legs.
- Ensure the webbing is centered on the animal's back
- The webbing is now “threaded” evenly between the rear legs of the animal (a reach tool may be required to lift the upper leg of a recumbent animal to allow the webbing to pass between its rear legs)

Lark’s foot configuration:
- Instead of both ends of the webbing being passed evenly between the animal’s rear legs (basket configuration), one end of the webbing is threaded through the loop of the other end and threaded between the rear legs.
- This method places significant pressure on the animal's abdomen and has the potential to cause serious injury. If used it should be performed as quickly as possible.
- This configuration is not a primary rescue method.

- The webbing is pulled taut in preparation for hauling.
- The animal handler calls the command “haul”
- When the animal is free of its entrapment drop the webbing
- The animal handler maintains control of the head but allows the animal to use its head and neck to right itself
Reminders:

Action at Scene

- Establish scene safety
- Establish incident command and operate under the Incident Management System (IMS) framework
- Establish an Incident Action Plan
- Acquire rescue equipment and human resources (i.e. may need a veterinarian on scene or an individual with specific livestock expertise)
- Establish containment facilities

Animal Safety

- Heads, tails and limbs are not handles – DO NOT use them for pulling (serious injury and potentially life threatening injury can result)
- Always protect the animal's eyes
- Establish and maintain head control at all times.
- Allow a rescued animal the time it needs to stand if it has been rescued from a downed position. DO NOT force it to stand and move.
- Some animals may need sedation prior to performing the rescue to reduce the risk of injury to the animal and responders
